1. Introductions

1.1 System Description

FSM-6228G is 28-port Managed switches deliver high quality, wide operating temperature range, extended power input range, IP-30 design, and advanced VLAN & QoS features. It's ideal for harsh environments and mission critical applications.

Managed QoS FSM-6228G provides enterprise-class networking features to fulfill the needs of large network infrastructure and extreme environments.

FSM-6228G series Managed switches ease the effort to build a network infrastructure which offers a reliable, well managed and good QoS networking for any business requiring continuous and well-protected services in industrial environments. With the features such as Fast Failover ring protection, Ethernet OAM, IEEE 1588v2 / Sync-E and QoS, customers can ensure their network is qualified to deliver any real-time and high quality applications.

1.2 Using the Web Interface

The object of this document "FSM-6228G Series Web Configuration Tool Guide" is to address the web feature, design layout and describe how to use the web interface.

1.2.1 Web Browser Support

IE 7 (or newer version) with the following default settings is recommended:

Language script	Latin based
Web page font	Times New Roman
Plain text font	Courier New
Encoding	Unicode (UTF-8)
Text size	Medium

Firefox with the following default settings is recommended:

Web page font	Times New Roman
Encoding	Unicode (UTF-8)
Text size	16

Google Chrome with the following default settings is recommended:

Web page font	Times New Roman
Encoding	Unicode (UTF-8)
Text size	Medium

1.2.2 Navigation

All main screens of the web interface can be reached by clicking on hyperlinks in the three menu boxes on the left side of the screen:

- **Status** - Display statistics, status, and contents of memory.
- **Configuration** - Configure the system, interfaces, and filters.
- **System** - Display system information, download firmware, back up configurations, and modify users.

You can find the detailed information in section 2.2 Tree View.

Help Button

For more information about any screen, click on the Help button on the screen.

Help information is displayed in the same window.

Save Button

If any unsaved change has been made to the *configuration* (by you during this or a prior session, or by any other administrator using the web interface or the Command Line Interface), a Save icon appears in the title line. To save the running configuration to the startup configuration:

1. Click on the Save icon. The System/Save and Restore screen appears.
2. Click on Submit next to Data Control Action drop-down list on top of System/Save and Restore screen.

1.2.4 Ending a Session

To end a session, close your web browser. This prevents an unauthorized user from accessing the system using your user name and password.

1.3 Using the Online Help

Each screen has a  Help button that invokes a page of information relevant to the particular screen. The Help is displayed in a new window.

Each web page of Configuration/Status/System functions has a corresponding help page.

2. Using the Web

2.1 Login

Web Interface Login

Username:

Password:

[Sign in](#)

Operation	1. Fill Username and Password 2. Click "Sign in"
Field	Description
Username	Login user name. The maximum length is 32. Default: admin
Password	Login user password. The maximum length is 32. Default: admin

2.2 Tree View

The tree view is a menu of the web. It offers user quickly to get the page for expected data or configuration.

Operation

Create New:

1. Click "Create New" button to open "Create New" page.
2. Set VID and Name.
3. Click fields to change status.
4. Click "Apply" button to create, or click "Cancel" button to cancel.

Modify:

1. Click "Modify" button to open "Modify" page.
2. Modify Name.
3. Click "Apply" button to modify, click "Cancel" button to cancel.

Delete:

1. Choice "VID" to select.
2. Click "Delete" to delete selected VLAN.

Refresh:

1. Click "Refresh" button to get current data.

Field	Description
Port	Range: GE-1 ~ MAX Number of Port
Priority	Range: 0~240 in step 16, Default is default=0x80(128).

Edge	Range: Enabled/Disabled, default=Disabled.
State	<p><i>Range:</i> Disabled/ Blocking/ Listening/ Learning/ Forwarding/ Broken</p> <p><i>Disabled :</i> For ports which are disabled (see dot1dStpPortEnable), this object will have a value of disabled.</p> <p><i>Blocking:</i> The port will go into a blocking state at the time of selection process, when a switch receives a BPDU on a port that indicates a better path to the root switch, and if a port is not a root port or a designated port.</p> <p><i>Listening:</i> After blocking state, a root port or a designated port will move to a listening state. All other ports will remain in a blocked state. During the listening state the port discards frames received from the attached network segment and it also discards frames switched from another port for forwarding. At this state, the port receives BPDUs from the network segment and directs them to the switch system module for processing. After a forward time delay (The default forward delay time is 15 seconds.), the switch port moves from the listening state to the learning state.</p> <p><i>Learning:</i> A port changes to learning state after listening state. During the learning state, the port is listening for and processing BPDUs. In the listening state, the port begins to process user frames and start updating the MAC address table. But the user frames are not forwarded to the destination. After a forward time delay (The default forward delay time is 15 seconds), the switch port moves from the learning state to the forwarding state.</p> <p><i>Forwarding:</i> A port in the forwarding state forwards frames across the attached network segment. In a forwarding state, the port will process BPDUs, update its MAC Address table with frames that it receives, and forward user traffic through the port. Forwarding State is the normal state. Data and configuration messages are passed through the port, when it is in forwarding state.</p> <p><i>Broken:</i> If the bridge has detected a port that is malfunctioning it will place that port into the broken state.</p>
STP Port	Range: Enabled/ Disabled, Default is Enabled.
Path Cost	Range: 1 ~ 200000000, Default is 20000.
Designated Root	<p>The parameter is the unique Bridge Identifier of the Bridge recorded as the Root in the Configuration BPDUs transmitted by the Designated Bridge for the segment to which the port is attached.</p> <p>Format : Root bridge priority + Root Bridge MAC address</p>
Designated Cost	The parameter is the path cost of the Designated Port of the segment connected to this port. This value is compared to the Root Path Cost field in received BPDUs.

Designated Bridge	The parameter is the Bridge Identifier of the bridge which this port considers to be the Designated Bridge for this port's segment. Format: Designated bridge priority + Designated Bridge MAC address. [0x8000-001122334455]
Designated Port	The parameter (dot1dStpPortDesignatedPort) is the Port Identifier of the port of the Designated Bridge for this port's segment. Format: Designated port priority + Designated Port ID. [0x8001]
Forward Transitions	Forward Transitions count.

Field	Description
Port	Range: GE-1 ~Maximum Number of Port.
Input Bytes	The total number of octets received on the interface, including framing characters.
Input Unicast Pkts	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast address at this sub-layer.
Input Multicast Pkts	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional address.
Input Broadcast Pkts	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were addressed to a broadcast address at this sub-layer.
Input Discard Pkts	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.

Input Error Pkts	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol.
Output Bytes	The total number of octets transmitted out of the interface, including framing characters.
Output Unicast Pkts	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent.
Output Multicast Pkts	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional address.
Output Broadcast Pkts	The total number of packets that higher-level protocol requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent.
Output Discard Pkts	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.
Output Error Pkts	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors.

2.4.6 RMON

Jabbers	0	Collisions	0
Drop Events	0		

Operation	<p><u>Refresh:</u></p> <p>Click "Refresh" button to refresh current data.</p> <p><u>Clear:</u></p> <ol style="list-style-type: none"> 1. Select clear port. 2. Click "Clear" to clear setting physical port data.
Field	Description
Pkts 64 Octets	Total number of packets (including bad packets) received that were 64 octets in length.
Pkts 65 to 127 Octets	Total number of packets (including bad packets) received that were between 65 and 127 octets in length.
Pkts 128 to 255 Octets	Total number of packets (including bad packets) received that were between 128 and 255 octets in length.
Pkts 256 to 511 Octets	Total number of packets (including bad packets) received that were between 256 and 511 octets in length.
Pkts 512 to 1023 Octets	Total number of packets (including bad packets) received that were between 512 and 1023 octets in length.
Pkts 1024 to 1518 Octets	Total number of packets (including bad packets) received that were between 1024 and 1518 octets in length.
Octets	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets).

Packets	The total number of packets (including bad packets, broadcast packets, and multicast packets)received
Broadcast Pkts	The total number of good packets received that were directed to the broadcast address. Note that this does not include multicast packets
Multicast Pkts	The total number of good packets received that were directed to a multicast address. Note that this number does not include packets directed to the broadcast address.
CRC Align Errors	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
Undersize Pkts	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.
Oversize Pkts	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.
Fragments	The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
Jabbers	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
Collisions	The best estimate of the total number of collisions on this Ethernet segment.
Drop Events	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.

2.4.8 Ring Protection Status

Status / Ring Status
?

Refresh

Previous Command Result: Normal

Ring Status

Group index	Ring ID	Mode	Role	State	Guard timer	Node1	Node2
1	1	Disabled	Slave	Idle (No Link error)	10	Port-1 Link status : Link Down Port state : Forwarding Port type : SF Port	Port-2 Link status : Link Down Port state : Forwarding Port type : SF Port
2	2	Disabled	Slave	Idle (No Link error)	10	Port-3 Link status : Link Down Port state : Forwarding Port type : SF Port	Port-4 Link status : Link Down Port state : Forwarding Port type : SF Port
3	3	Disabled	Slave	Idle (No Link error)	10	Port-5 Link status : Link Down Port state : Forwarding Port type : SF Port	Port-6 Link status : Link Down Port state : Forwarding Port type : SF Port

Ring Neighbors

Group index	Ring ID	Discovery Mode	Discovery timer	Master Mac	Node1 Neighbor	Node2 Neighbor
1	1	Disabled	10	--	--	--
2	2	Disabled	10	--	--	--
3	3	Disabled	10	--	--	--

Operation	<u>Refresh:</u> Click "Refresh" button to refresh current data.
Field	Description
Group Index	The group index. This parameter is used for easy to identify the ring when user to configure it.
Ring ID	The Ring parameter is used for identify whether ring in same group on protocol level. Range: 1 ~ 255
Mode	The Ring is Enabled or Disabled.

Role	<p>The role (Master/Slave) of the switch in the Ring. Per Ring can have one Master and more Slaves.</p> <p>If this cell display with Interconnect which is meaning the Ring can inter-connect with other Ring for coupling and multi-homing application. In another words, this switch have 2 ring group share one port as the ring node. Per ring group have 2 nodes in one switch.</p>
State	<p>The protection state of the ring. Idle (No error) may means ring is Disabled or Protection port is blocking state and no any link error on all of the ring nodes belong to this ring group on the switch. If this switch is master of the ring, then this parameter can help operators to well identify the ring happen link broken or not.</p> <p>Active (Link error) may have link broken on ring ports.</p> <p>If this switch is master of the ring, then this state also will meaning the Signal failure happen between ring nodes at least in one of the switches belong to the ring.</p>
Guard timer	<p>Guard timer is a timeout value for count down a port from blocking to forwarding state when link up.</p> <p>This is in order to protect the ring do not switch the protection state from Active to Idle frequently when link status is not stable.</p>
Node1	<p>Include below information:</p> <p>Port id of Node1. (Protect Port) may display when the switch in the ring group is Master. When Ring is Idle and no any link error, the Protect Port of the Master is blocking state to prevent loop in a physical loop condition</p> <p>Link status of Node1 : Link down or Link up.</p> <p>Port state of Node1 : Forwarding or Blocking</p> <p>Port type of Node1 : SF port(In general case, all of the ring ports must configure as SF port) or Non-SF port(Only use for coupling or multi-homing application).</p>

<p>Node2</p>	<p>Include below information:</p> <p>Port id of Node2. (Protect Port) may display when the switch in the ring group is Master. When Ring is Idle and no any link error, the Protect Port of the Master is blocking state to prevent loop in a physical loop condition</p> <p>Link status of Node2 : Link down or Link up.</p> <p>Port state of Node2 : Forwarding or Blocking</p> <p>Port type of Node2 : SF port(In general case, all of the ring ports must configure as SF port) or Non-SF port(Only use for coupling or multi-homing application).</p>
<p>Discovery Mode</p>	<p>Discovery Mode is to enable or disable the ring neighbor discovery protocol. This parameter only for management purpose. It is in order to let management system to well identify the ring topology.</p>
<p>Discovery timer</p>	<p>Discovery timer is the timeout value for count down to send ring neighbor discovery protocol to other ring nodes for ring topology discovery purpose.</p>
<p>Master Mac</p>	<p>Master Mac is the Mac address of the Master switch in the ring. -- is meaning Master Mac is unknown (The ring may under learning or some link is broken in the beginning. Check all of the ring links first.) or Discovery Mode is disabled.</p>
	<p>Node2 Neighbor will display the Mac address and Port-id of the Node1's neighbor switch in the ring. -- is meaning neighbor Mac is unknown (The ring may under learning or some link is broken in the beginning. Check all of the ring links first.) or Discovery Mode is disabled.</p>
<p>Node2 Neighbor</p>	<p>Node2 Neighbor will display the Mac address and Port-id of the Node2's neighbor switch in the ring. -- is meaning neighbor Mac is unknown (The ring may under learning or some link is broken in the beginning. Check all of the ring links first.) or Discovery Mode is disabled.</p>
